Session Objectives

1. What are Assembly Orders
2. Assembly Orders vs. Production Orders
3. Setups for Assemblies
4. Processing Assembly Orders
 - Assemble to Order
 - Assemble to Stock

What are Assembly Orders

- Formerly known as “Kitting”
- AKA – Light Production, Junior Production, etc.

Assembly orders are internal orders, just like production orders. Use assembly orders to manage the assembly process and to connect sales requirements with warehouse activities. Assembly orders involve both output and consumption when posting. Assembly order headers are similar to output journal lines. Assembly order lines are similar to consumption journal lines.

Licensing

- Assembly – Requires only Essential license
- Production – Requires Premium license

Assembly vs. Production

Similarities:

- Multi-level BOM
- Integration with sales, planning, reservations, logistics.
- To Stock and To Order
- Planning worksheet can be used to create AO
- Consume and output variants
- Can have assembly BOMs within assembly BOMs

Assembly vs. Production

Differences:

- No routing or capacity (resources instead)
- Versioning not available with assemblies
- Production BOM can include calculation formulas
- Production has various production order statuses
- Items and resources on same page (no separate BOM and Routing)
- Component and output can be posted separately.
- Consumption and Output Journals can be used.
- No negative Consumption or Output

Why Choose Manufacturing/Production

- Need tight control over the shop floor including workstation capacities and scheduling resources
- Have complex MRP requirements with the ability to manage the timing of inventory purchases or manufacture of sub-components.
- Need to manage scrap.
- Assembly routings are important.
- Linking consumption to routing steps needed
- Use Sub Contracting

Why Choose Assemblies

- Want your sales people to easily configure items and related assembly orders on the fly without regard to formal business rules.
- Don't care about shop floor management or capacity, or are willing to manage them manually from reports or a third party drag and drop scheduler.
- Order items solely on committed demand, min/max's, and inventory forecasts without any consideration of lead time.
- Want something simple and fast to implement. Assembly can be used in conjunction with Manufacturing in the future.
- Have a limited implementation budget.
- No WIP needed.

Assembly Setup

- Assembly Setup – Minimal settings

Assembly BOM

- Accessed through item list/card.
- Add items and resources.
- No versioning allowed or status changes.
- Can includes lot/serial tracked items.

Assemble to Order Process

- Assembly order tied to sales order through “Qty. to Assemble to Order” field on sales line.
- Assembly order automatically created.
- Assign lot/serial numbers to assembly order lines.
- Can create picks if needed.
- No posting of assembly order directly (Must post through sales order).
- Refresh lines if assembly BOM changed.
- Can add/delete assembly order lines as needed.

Assembly Orders

- On Assemble-to-Stock, BOM is not exploded until quantity is filled in.
- Allows you to make changes to assembly BOM (including variants).
- For Lot or Serial items, must assign lot/serial number(s) prior to posting.
- Can create warehouse picks from the assembly order.
- Limited scheduling is allowed.

Assemble to Stock Process

- Assembly order created manually (or through planning worksheet). Not tied to sales order.
- BOM explosion as soon as item and quantity are entered.
- Changes to assembly order lines allowed.
- Posting allowed on assembly order. Components posted when output posted (backward flushing).
- Can partially post output.

Assemble to Order/Stock

- If item is assemble to stock, you can still make assemble to order by entering quantity in Qty. at Assemble field on sales line.
- Qty. to Assemble quantity can be less than sales line quantity if some quantity assembled and some pulled from stock.
- Other features remain the same.

Quotes and Blanket Orders

- Assembly Quotes and Blanket Assembly Orders are used when an Assembly-to-Order items is placed on a sales quote or blanket sales order.
- A corresponding Assembly Quote or Blanket Assembly Order is also created.
- When the “Make Order” function is executed, the sales and assembly orders are also automatically created.

Summary

- Assemblies can be very efficient.
- Essential license is all that is needed. Everyone can use.
- Less complex setup and operation.
- Allows for basic production/assembly.

Thank you for attending!
